

Features that are a matter of course for items used in daily life should also be standard with professional transport equipment

The brand-new patented CLICK4 handle design is based on functions found in one of the most important items in daily use – the automobile.

The convenience offered to automobile drivers by height-adjustable steering wheel or individually adaptable seat is comparable with EXPRESSO's new safety handle with adjustable height and angle on our aluminium hand trucks for transport professionals.

The future has arrived – the attractive CLICK4 handle is here!

At last: Optimum functionality for height adjustment is now also available for hand truck handles. Apart from the special safety aspects, the CLICK4 provides everything needed for flexible and controlled transport with an ergonomic body posture. The benefits become apparent particularly when negotiating steps, because thanks to the simple adjustment of the CLICK4, the handle can be raised to a convenient height at the top of the stairs, and lowered again at the bottom.

With the new handle configuration of CLICK4, EXPRESSO Deutschland GmbH, the branded manufacturer of transport equipment, once again proves its leadership in terms of ergonomics and safety when moving loads.

CLICK4 is a perfect addition to EXPRESSO's range of safety handles for its modular hand truck system. Flexibility in use is the main benefit of the new CLICK4. Whether large or small, every user is able to transport heavy loads in his/her optimum body posture – thanks to the new handle's ingenious design. Different persons can now use the same hand truck conveniently.

In this respect, design also means handiness and excellent operability. Working equipment can be compared with clothing – a perfect fit is essential, i.e. it must be adapted precisely to the user and to the task to be performed. Only if all the prerequisites are fulfilled, can work be carried out optimally and therefore efficiently.

Fast and simple adaptation with sixfold safety

The four snap catches of the Quick-CLICK clamping system permit the geometry of the handle designed by EXPRESSO's experts to be adjusted as conveniently as the height of a modern bicycle seat. First, the two safety rockers are released by pressing them inwards. Now the handle can be brought to the required height easily. The perforated strip with fixed setting positions enables an individually preferred height to be found again easily. Moreover, EXPRESSO offers a precise ex-works angle adjustment in 10-degree steps to suit the user's individual preference. Conclusion: At last there is now an ergonomic height adjustment for hand trucks that supports and maintains the health of working personnel.
